

VibePick's Privacy Policy

VibePick is a mood-aware movie recommendation app, built as part of a bachelor's thesis project. Because real users try out the app to help test the recommendation algorithm, this page explains in plain terms what data gets collected, why and what you can do about it. By creating an account, you agree to the points below.

When you sign up, the app asks for your name, email, and a password. During onboarding you choose your favourite genres and the streaming services you use, since these feed the recommendation engine directly. While using the app, it keeps track of the moods you log, the films you mark as watched or add to your wishlist, and how you rate the helpfulness of each recommendation. It also quietly records which films were shown to you, the scores the algorithm gave them and whether you were shown mood-aware or baseline recommendations.

The app does not collect your precise location, advertising or device IDs, anything from your social media accounts, payment information or biometric data. Storing your preferences and mood logs relies on your consent, which you can withdraw any time by deleting your account. Your data sticks around for as long as your account exists. Deleting your account removes everything tied to you permanently.

VibePick stores your login token and basic account details in your browser's local storage. None of this is used for tracking or advertising, and no third-party cookies or analytics tools are used.
